

**CS4070 – PART 2**  
**EXERCISES RELATED TO LECTURE 3**

- (1) Assume  $X_1, \dots, X_p$  are independent conditional on  $\Theta_1, \dots, \Theta_p$ . Suppose  $X_i \mid \Theta_i = \theta_i \sim \text{Unif}(0, \theta_i)$ . Consider estimation of the parameters  $\Theta_1, \dots, \Theta_p$  based on data  $X_1, \dots, X_p$ .

- (a) Model  $\Theta_1, \dots, \Theta_p$  as independent with common density

$$f_{\Theta}(\theta) = \theta \lambda^2 e^{-\lambda \theta} \mathbf{1}_{[0, \infty)}(\theta)$$

for  $\lambda > 0$ . Show that  $\Theta_1, \dots, \Theta_p$  are a posteriori independent. Find their posterior distribution and verify that

$$\mathbb{E}[\Theta_i \mid X_i] = X_i + 1/\lambda.$$

- (b) If we use the posterior mean as estimator, then the performance of the estimator is highly depend on the choice of the hyperparameter  $\lambda$ . The method of empirical Bayes consists of plugging in an estimator for  $\lambda$ , based on

$$f_{X_1, \dots, X_p}(x_1, \dots, x_p) = \int f_{X_1, \dots, X_p \mid \Theta_1, \dots, \Theta_p}(x_p, \dots, x_p \mid \theta_1, \dots, \theta_p) f_{\Theta_1, \dots, \Theta_p}(\theta_1, \dots, \theta_p) d\theta_1, \dots, d\theta_p.$$

This is sometimes called the marginal likelihood, see also Section 3.9 in the book (which deals with a different statistical model, the underlying idea being the same as here).

Verify that  $\mathbb{E}[X_i] = 1/\lambda$  and explain why  $\hat{\Lambda} = 1/\bar{X}_n$  is an intuitively reasonable estimator for  $\lambda$ .

*Hint: use  $\mathbb{E}[X_i] = \mathbb{E}[\mathbb{E}[X_i \mid \Theta_i]]$ .*

- (c) Determine an estimator for  $\lambda$  by what is called *marginal maximum likelihood* (sometimes also called maximum likelihood type II). This means we find  $\lambda$  as the/a maximiser of

$$\lambda \mapsto f_{X_1, \dots, X_p}(x_1, \dots, x_p).$$

Note that the dependence on  $\lambda$  is suppressed from the notation, but enters via the prior distribution.

*To check your answer: you should find out that the marginal density of each  $X_i$  has the exponential distribution.*

- (d) Combine parts (a) and (b) (or (c)) to find empirical Bayes estimators for  $\Theta_1, \dots, \Theta_p$ . This means the estimator for  $\lambda$  is plugged in into the posterior mean found under part (a).
